Employment

Quality Control Operator

Aug 2023 - Feb 2024

Greengrower, Hamilton

Grow clean, sustainable, nutritious fresh produce using vertical framing.

- As the produce grows from a seedling until it is packaged, it required a fully controlled environment.
- Rooms for germination, harvest and cold rooms had to be manually washed and cleaned.
- Transplanted seedlings to trays
- Managed the produce going in the green area where it grows with special UV- light recipes
- Programmed computerized systems to control cutting height and speeds as well as measuring the weight of the harvested produce
- Bashed out trays to clean it from byproduct and leftover soil
- Quality control of the produce's growth and health
- Packed and inspected of errors in packaging which needs to be repacked
- Used specialized equipment to waterblast white trays and power washing black trays, removing all organic matter, ensuring no contaminants remain and when the trays are re-used for the next cycle
